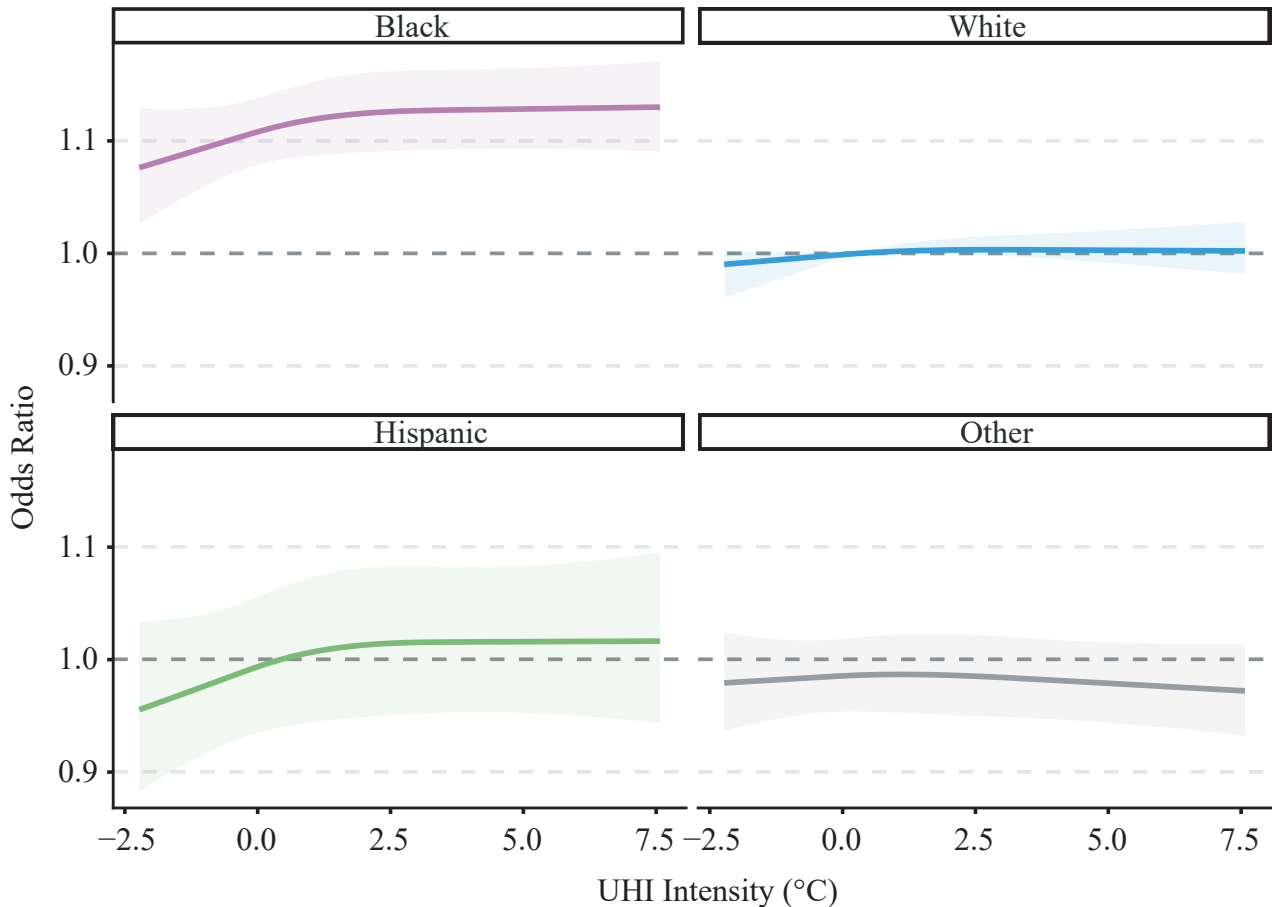

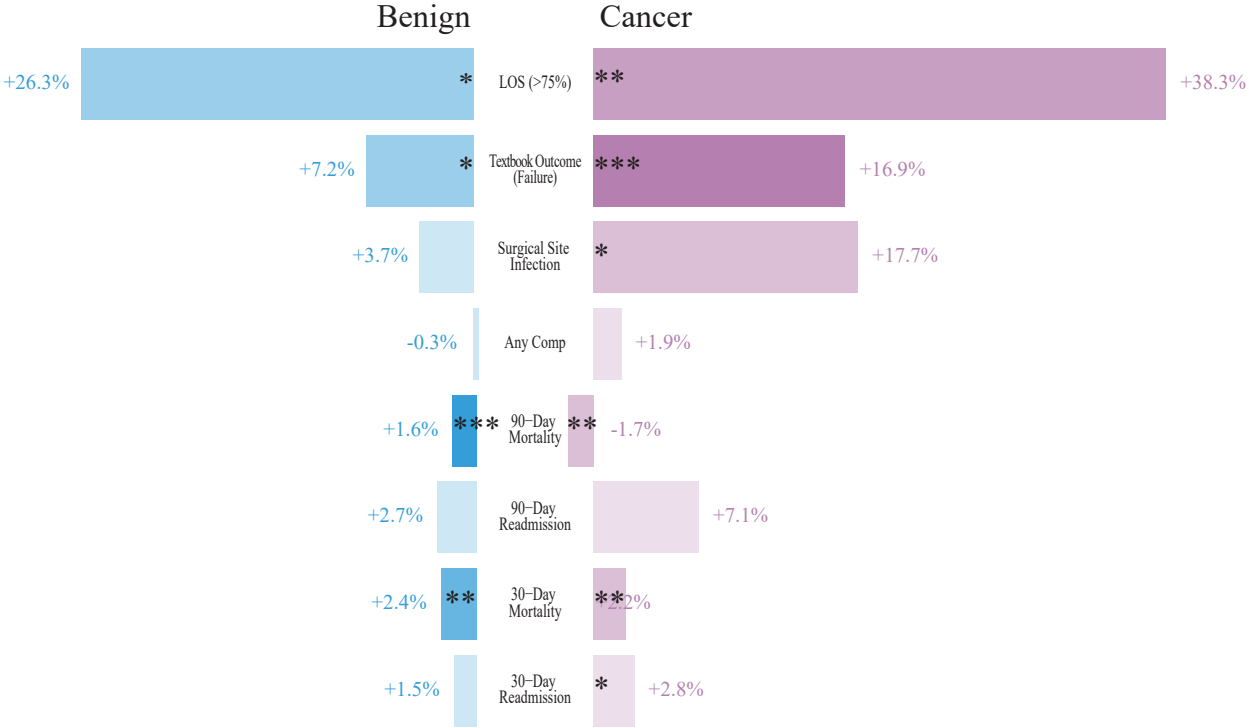

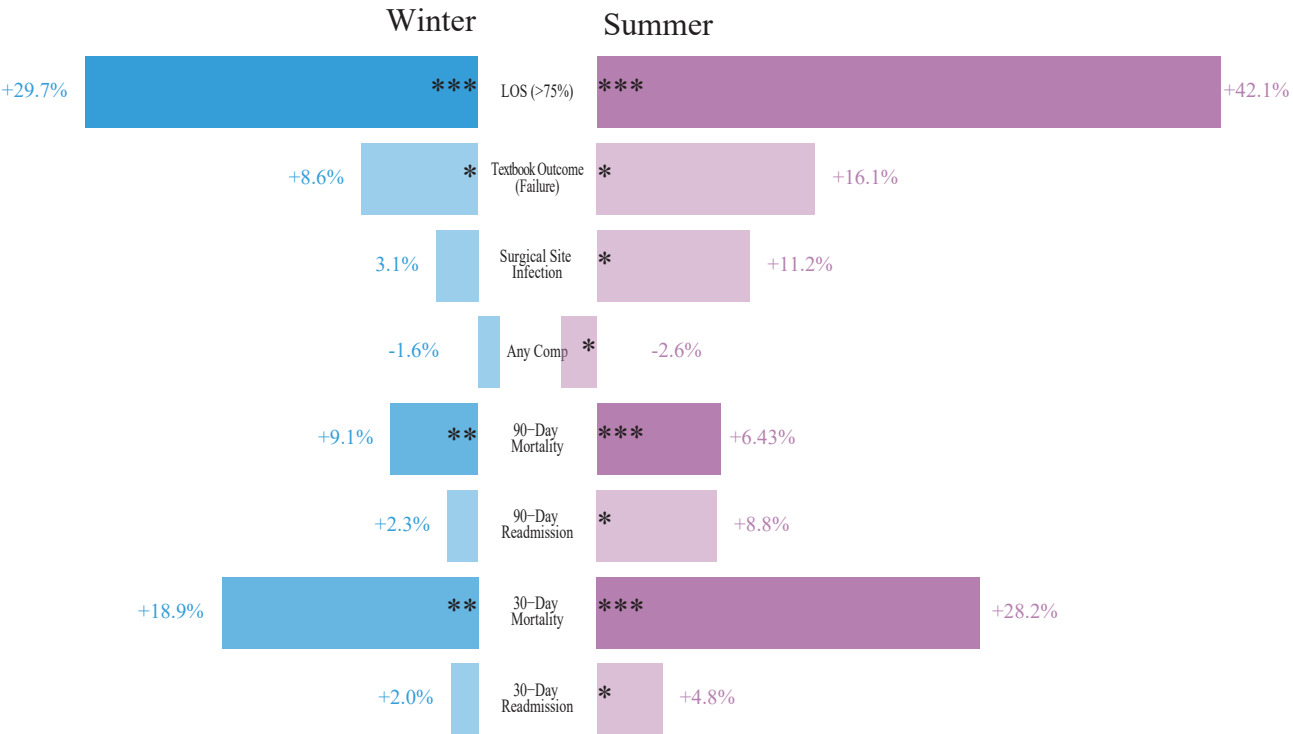

Figure 3A. Vulnerability: Cancer vs Benign

Metric Calculation: The plotted values represent the relative percentage change in odds, derived from the multivariable logistic regression model using the formula: $(\text{Odds Ratio} - 1) \times 100\%$. A value of 0 corresponds to an OR of 1 (no effect); positive values indicate increased odds, while negative values indicate decreased odds relative to the baseline.

Significance Indicators: Statistical significance is visually encoded in two ways:
1. Color Intensity: The saturation (opacity) of the bars corresponds to the P-value magnitude, with darker hues indicating smaller P-values (stronger statistical evidence).
2. Asterisks: Specific significance thresholds are denoted as: * P < .05, ** P < .01, and *** P < .001.

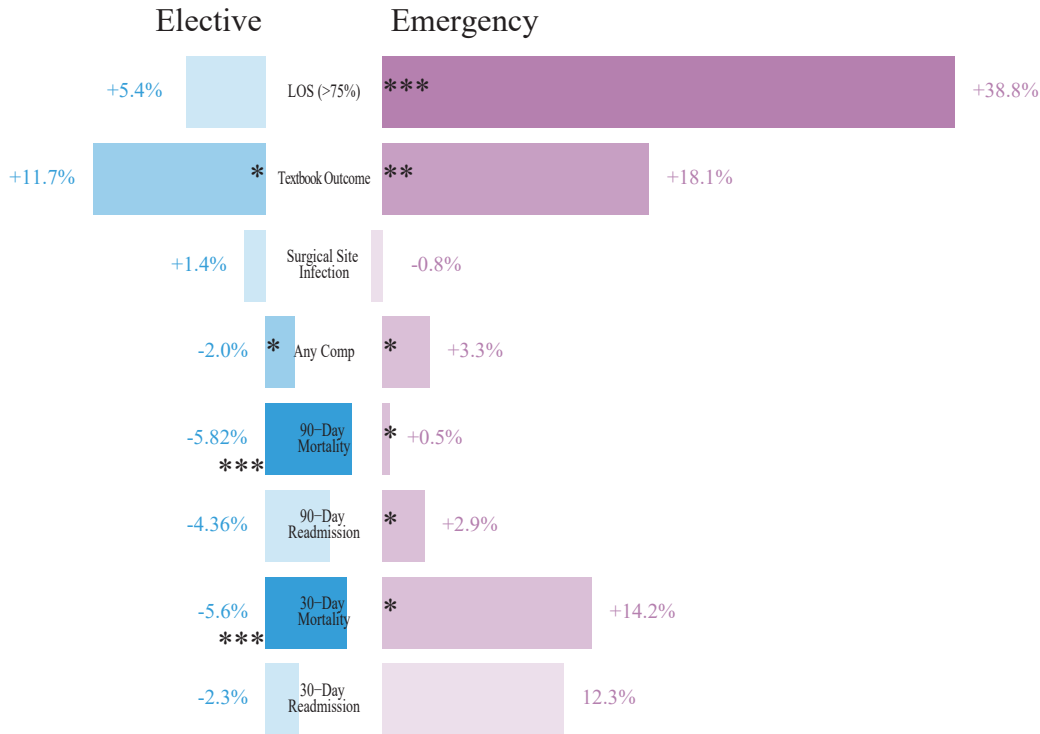

Figure 3B. Vulnerability: Summer vs Winter

Metric Calculation: The plotted values represent the relative percentage change in odds, derived from the multivariable logistic regression model using the formula:
$$\$(Odds\ Ratio - 1)\times 100\%\$.$$

A value of 0 corresponds to an OR of 1 (no effect); positive values indicate increased odds, while negative values indicate decreased odds relative to the baseline.
Significance Indicators: Statistical significance is visually encoded in two ways:
1. Color Intensity: The saturation (opacity) of the bars corresponds to the P-value magnitude, with darker hues indicating smaller P-values (stronger statistical evidence).
2. Asterisks: Specific significance thresholds are denoted as: * P < .05, ** P < .01, and *** P < .001.

Figure 3C. Vulnerability: Emergency vs Elective

Metric Calculation: The plotted values represent the relative percentage change in odds, derived from the multivariable logistic regression model using the formula:
$$(\text{Odds Ratio} - 1) \times 100\%$$

A value of 0 corresponds to an OR of 1 (no effect); positive values indicate increased odds, while negative values indicate decreased odds relative to the baseline.

Significance Indicators: Statistical significance is visually encoded in two ways:

1. Color Intensity: The saturation (opacity) of the bars corresponds to the P-value magnitude, with darker hues indicating smaller P-values (stronger statistical evidence).

2. Asterisks: Specific significance thresholds are denoted as: * P < .05, ** P < .01, and *** P < .001.
